

Job Description - Export Trial Contact Data from Human Research Switzerland

Source:

<https://www.humanforschung-schweiz.ch/en/trial-search/#>

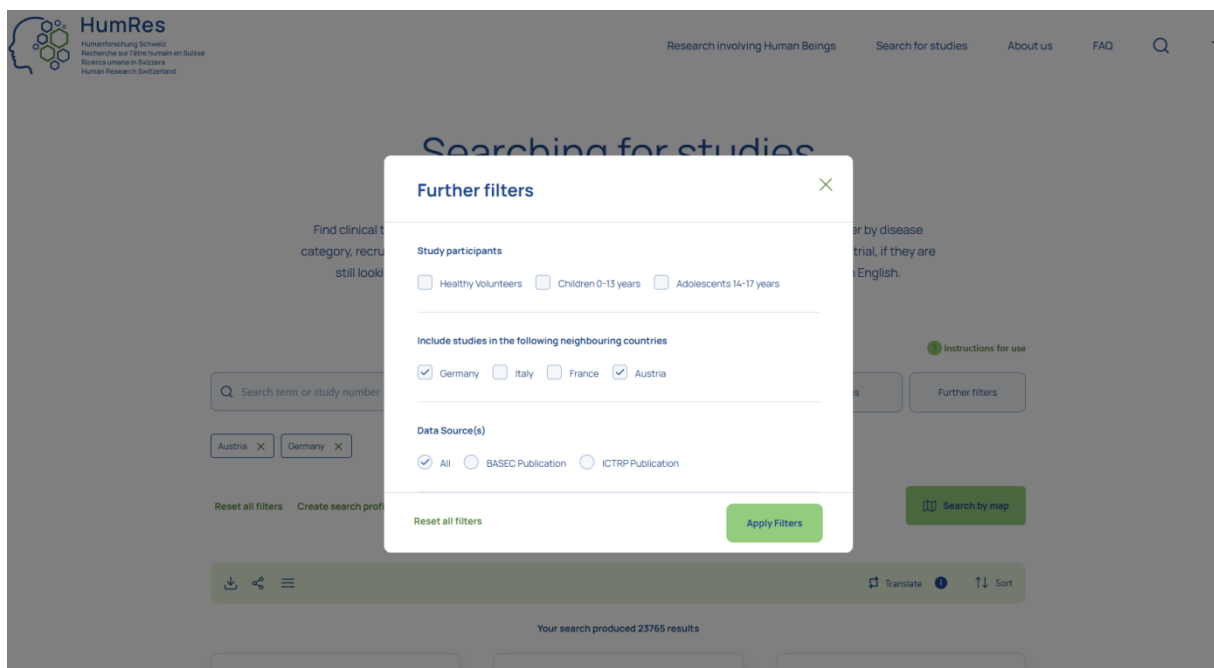

Goal:

Extract contact data from trial records listed on Human Research Switzerland and build a structured Excel database containing the visible contact details from each study detail page for all studies returned by the search after applying the Further filters and selecting Germany and Austria.

The goal is to collect the contact information exactly as displayed on the website, together with the related study metadata.

Scope of Work

- Go through the studies listed in the Human Research Switzerland trial search.
- Go to Further filters
- Select Germany and Austria

- Open each individual study detail page.
- Collect data from the **Contact** section on each study page.
- On these study pages, the Contact section may contain one or more separate contact blocks. Examples visible on the website include:
 - Contact Person Switzerland
 - General Information
 - Scientific Information
- Treat each visible contact block as a separate contact entry.
- If a study contains more than one contact block, create separate Excel rows for each one.

- If one of the contact blocks is missing, empty, or shows no useful contact data, skip that block and continue with the next one.
- Do not collect data manually. I need an automated scraping solution.

Special Case Note

On some study pages, the same contact header may appear multiple times, for example several blocks titled “General Information”. These must not be merged into one record. Each visually separate contact block must be extracted as a separate Excel row, even if the header text is identical.

Important website structure rule

For this website, a “contact entry” means one visible block inside the **Contact** section of the study page.

Disease category	Contact	
Other (BASEC)		
Study Phase	Contact Person Switzerland	
Phase 1	Dr. Friederike Holze	General Information

Data Source(s)		

Example:

If one study page shows:

- Contact Person Switzerland
- General Information
- Scientific Information

a contact block should be included if at least one of the following is present: Raw Contact Text, Contact Email Address, Contact Phone Number, Institution Name, or Displayed Source Tag.

If the same header appears more than once on the same study page, for example multiple blocks titled General Information, then all of those blocks must be extracted. They must not be merged into one record just because they share the same header.

Required Fields (Excel headers - exact wording and order)

1. **Study ID** - Copy the visible study identifier string shown at the very top of the study detail page, above the study title.
On this website, the top line may contain multiple identifiers separated by vertical bars, for example:
HumRes65792 | SNCTP000006055 | BASEC2024-01503 | NCT06796361
2. **Study Title** - Copy the main study title shown directly below the identifier line at the top of the study detail page.
3. **Study URL** - Copy the direct URL of the study detail page.
4. **Contact Block Title** - Go to the Contact section of the study detail page. Inside that section, each separate visible contact block has its own heading. Examples include: Contact Person Switzerland General Information Scientific Information Copy that heading exactly as shown for the relevant block.
5. **Raw Contact Text** - Within the selected contact block, copy the original visible contact content exactly as shown in that block before splitting anything into separate fields. This may include a person name, an organisation name, a hospital name, a

university name, a department name, or other displayed contact text. The purpose of this field is to preserve the original displayed contact content

6. **Contact First Name** - Fill this only if the contact block clearly contains a real person's name. Take the first name from the personal name shown inside that contact block.
7. **Contact Last Name** - Fill this only if the contact block clearly contains a real person's name. Take the last name from the personal name shown inside that contact block.
8. **Contact Email Address** - Within the selected contact block, copy the email address exactly as displayed. Do not infer or search for missing emails elsewhere on the page.
9. **Contact Phone Number** - Within the selected contact block, copy the phone number exactly as displayed. Store it as text, not as a number. Keep the original formatting, including +, spaces, and parentheses if present.
10. **Institution Name** - Within the selected contact block, copy the visible institution, organisation, hospital, university, clinic, or department name associated with that contact, if shown. Example: University Hospital Basel If no institution is shown inside that block, leave this field blank.
11. **Displayed Source Tag** - Copy the visible source marker shown for that contact block or its contact data, usually in parentheses. Examples visible on the website include: (BASEC) (ICTRP) Copy only what is actually displayed on the page for that contact block. Do not infer it from another section.

All contact-related fields must be taken from the Contact section of the study detail page. Do not fill contact fields from other non-contact sections of the page, such as Sponsor, the page-level General information section, Additional contacts, Data Source(s), or external linked registries, unless the same value is visibly shown again inside the Contact section itself. For avoidance of doubt: the contact block titled "General Information" inside the Contact section is valid and must be scraped. The restriction above refers only to other non-contact sections elsewhere on the page.

Formatting Rules

- One row = one visible contact block.
- Leave empty cells blank. Do not use "N/A", "-", or placeholder text.
- Keep all special characters exactly as displayed. UTF-8 encoding is important.
- Copy all data exactly as shown on the website.
- Do not normalize phone number formats.
- Do not rewrite organisation names.
- Do not deduplicate rows globally. If the same email or same phone number appears in multiple studies or multiple contact blocks, keep those rows.
- The final file must be easy to filter in Excel.

Rule for splitting names

If the contact clearly looks like a real person's name, split it into:

- Contact First Name
- Contact Last Name

Examples of likely personal names:

- Dr. Friederike Holze
- John Smith
- Maria Rossi

If the contact does **not** clearly look like a real person, do **not** guess.
In that case:

- keep the original value in **Raw Contact Text**
- leave **Contact First Name** empty
- leave **Contact Last Name** empty

This is very important.

Do not split organisation names, department names, or generic labels into fake first and last names.

Examples of entries that should usually keep empty name fields

- department names
- organisation names
- hospital names
- university names
- generic labels
- phone-only blocks
- email-only blocks

Step 1 - Opening study pages

Goal:

Open each study detail page from the Human Research Switzerland search results.

1. Open the Human Research Switzerland trial search.
2. Go through all study results that are available in the all studies currently available in the Human Research Switzerland trial search.
3. Open each study detail page individually.
4. Work on the study detail page itself, not only the result list.

Step 2 - Extracting study-level metadata

Goal:

Capture the basic study metadata from the top of the study detail page.

From the study page, collect:

- Study ID
- Study Title
- Study URL

Copy these exactly as displayed.

Step 3 - Extracting contact data

Goal:

Capture all visible contact data from the Contact section.

1. Scroll to the **Contact** section of the study detail page.
2. Identify each separate visible contact block inside that section.
3. For each block, extract the fields listed above.
4. Create one Excel row per contact block.

What counts as a separate contact block

A separate block is identified by its own visible heading inside the Contact section.

Examples:

- Contact Person Switzerland
- General Information
- Scientific Information

These headings must go into the **Contact Block Title** column exactly as shown.

How to capture Raw Contact Text

For each contact block, preserve the original visible contact content in one field before parsing it further.

That means the output should not lose the original display value even if name splitting is later applied.

How to capture Institution Name

If a contact block includes an organisation, clinic, hospital, university, or department name, place it in the **Institution Name** column exactly as shown.

If no institution is shown for that block, leave the field blank.

How to capture Displayed Source Tag

If the contact block shows a source marker such as (BASEC) or (ICTRP), capture that value in the **Displayed Source Tag** column.

If no visible source tag is shown for that specific contact block, leave the field blank.

Do not infer missing values from other sections

Only capture what is actually visible on the page for that contact block.

Do not enrich missing contact data from sponsor fields, other sections, external registries, or linked websites.

If a contact block contains only partial data

Still include the row if the block contains useful visible information.

Examples:

- phone number only

- email only
- person name only
- organisation only
- organisation + phone but no email

Do not skip a valid visible contact block just because one field is missing.

What should be skipped

Skip only:

- missing contact blocks
- empty blocks
- blocks showing no usable visible content

Deliverables

- Final Excel file with the exact columns listed above
- The script / source code used for scraping
- A sample file before full delivery

Sample Requirement Before Full Delivery

Before completing the full scrape, send a sample of approximately 20 to 30 rows so I can verify:

- row structure
- handling of contact block titles
- name splitting logic
- source tag extraction
- phone formatting
- raw text preservation

Do not continue with the full scrape until the sample is approved.

Final Quality Check (before delivery)

- Each row = one visible contact block from the Contact section
- Contact Block Title matches the exact heading shown on the website
- Raw Contact Text preserves the original visible contact text
- Real people have first name / last name split correctly
- Non-personal or generic contacts keep empty name fields
- Phone numbers are copied exactly as displayed
- Institution names are copied exactly as displayed
- Displayed Source Tag matches the visible tag shown on the website
- Empty values are left blank
- The column order matches the list above
- The result is clean and easy to filter in Excel

When applying, please include

- your scraping method

- estimated delivery time
- fixed price
- whether the site can be scraped via browser automation, structured requests, or another method
- confirmation that you will provide both the Excel output and the source code

Additional note

Please do not apply if you plan to do this manually.

I need an automated scraping solution with accurate field mapping.
